GEOLOGIC CROSS-SECTION A-B

BEDROCK GEOLOGY OF THE DAVENPORT WEST 7.5' QUADRANGLE, SCOTT COUNTY, IOWA

Iowa Geological Survey
Open File Map OFM-09-03
June 2009

prepared by

Robert McKay, Huaibao Liu, Stephanie Tassier-Surine, and James D. Giglierano

Iowa Geological Survey, Iowa City, Iowa

Iowa Department of Natural Resources, Richard A. Leopold, Director
Iowa Geological Survey, Robert D. Libra, State Geologist

Supported in part by the U.S. Geological Survey
Cooperative Agreement Number 08HQAG0082
National Cooperative Geologic Mapping Program (STATEMAP)

ACKNOWLEDGMENTS

New subsurface geologic data was generated by the University of Iowa students Sarah Byram and Kyle Bracken who produced descriptive logs of water well drill samples. Deborah Quade of Iowa Geological Survey (IGS) lent support with Quaternary field and office expertise; Murray Perdue (IGS) prepared well samples for stratigraphic logging; Ray Anderson (IGS) provided updated bedrock topography data; Brian Witzke (IGS) provided valued information concerning the Silurian and Devonian stratigraphy of the area; and Chris Kahle and Andy Asell (IGS) provided GIS mapping technical help.

LEGEND

CENOZOIC

QUATERNARY SYSTEM

Qu

Qu - Undifferentiated unconsolidated sediment Consists of loamy soils developed in loess and glacial till of variable thickness, and alluvial clay, silt, sand and gravel, with a maximum thickness locally exceeding 60 m (200 ft). Unit shown only on cross-section, not on map.

PALEOZOIC

PENNSYLVANIAN SYSTEM

Pcc

Pcc – Shale, Siltstone and Sandstone (Cherokee Group and Caseyville Formation undifferentiated) Lower and Middle Pennsylvanian. The thickness of this formation may exceed 60 m (200 ft), but in general is less than 30 m (100 ft). Primary lithologies includes gray shale, siltstone, and minor sandstone. Secondary lithologies include black carbonaceous shale and coal; plant fossils, pyrite, and siderite pellets & concretions may be present.

DEVONIAN SYSTEM

Dc

Dc - Limestone (Cedar Valley Group) Middle Devonian. This map unit includes the Little Cedar Formation, and reaches a maximum thickness of 9 m (30 ft). The Little Cedar is composed of fossiliferous to sparsely fossiliferous limestone and argillaceous limestone containing a diverse marine fauna including echinoderms, corals, brachiopods and bryozoans; bioturbated fabrics are common.

Dw

Dw - Dolomite, Limestone, Shale, and minor Sandstone (Wapsipinicon Group) Middle Devonian. This map unit includes the Otis and the Pinicon Ridge formations, with a total thickness between 18 and 29 m (60-95 ft). The Otis Formation is dominated by lithographic to sublithographic, pelletal limestone, with minor dolomite near its base. The Pinicon Ridge Formation is characterized by laminated or brecciated, unfossiliferous limestone and dolomite with minor shale.

SILURIAN SYSTEM

Sg

Sg - Dolomite (Gower Formation) Silurian. Thickness of this formation ranges between 27 and 37 m (90-120 ft), and the lithology is dominated by porous dolomite, in part laminated, and vuggy. Brachiopods and corals are common in mounded facies.

Ss

Ss - Dolomite and minor Chert (Scotch Grove Formation) Lower Silurian. The thickness of this interval ranges between 35-45 m (120-150 ft), and is characterized by fossil moldic (especially crinoidal) dolomite. Vugs and pores are common in most part, and minor chert may occur in lower part of the formation.
